

### (a) Spacing decides ghost collisions

a ghost returns at  $\tau_a - \tau_b + \tau_c$

**uniform spacing: every ghost lands on a grating**

10 ghost paths return inside the array, 10 on a grating

**randomized spacing: almost none does**

9 ghost paths return inside the array, 1 on a grating

delay bin  $\tau$  (grating position)

### (b) Side-lobe leakage, $K = 32$
